THE PROJECT: OBJECTIVES AND WORK PACKAGES

in 4 WORK PACKAGES

- 1) Unbiased census of BH winds
- 2) Physics of multiphase gas
- 3) Local BH mass functions
- 4) BH wind models

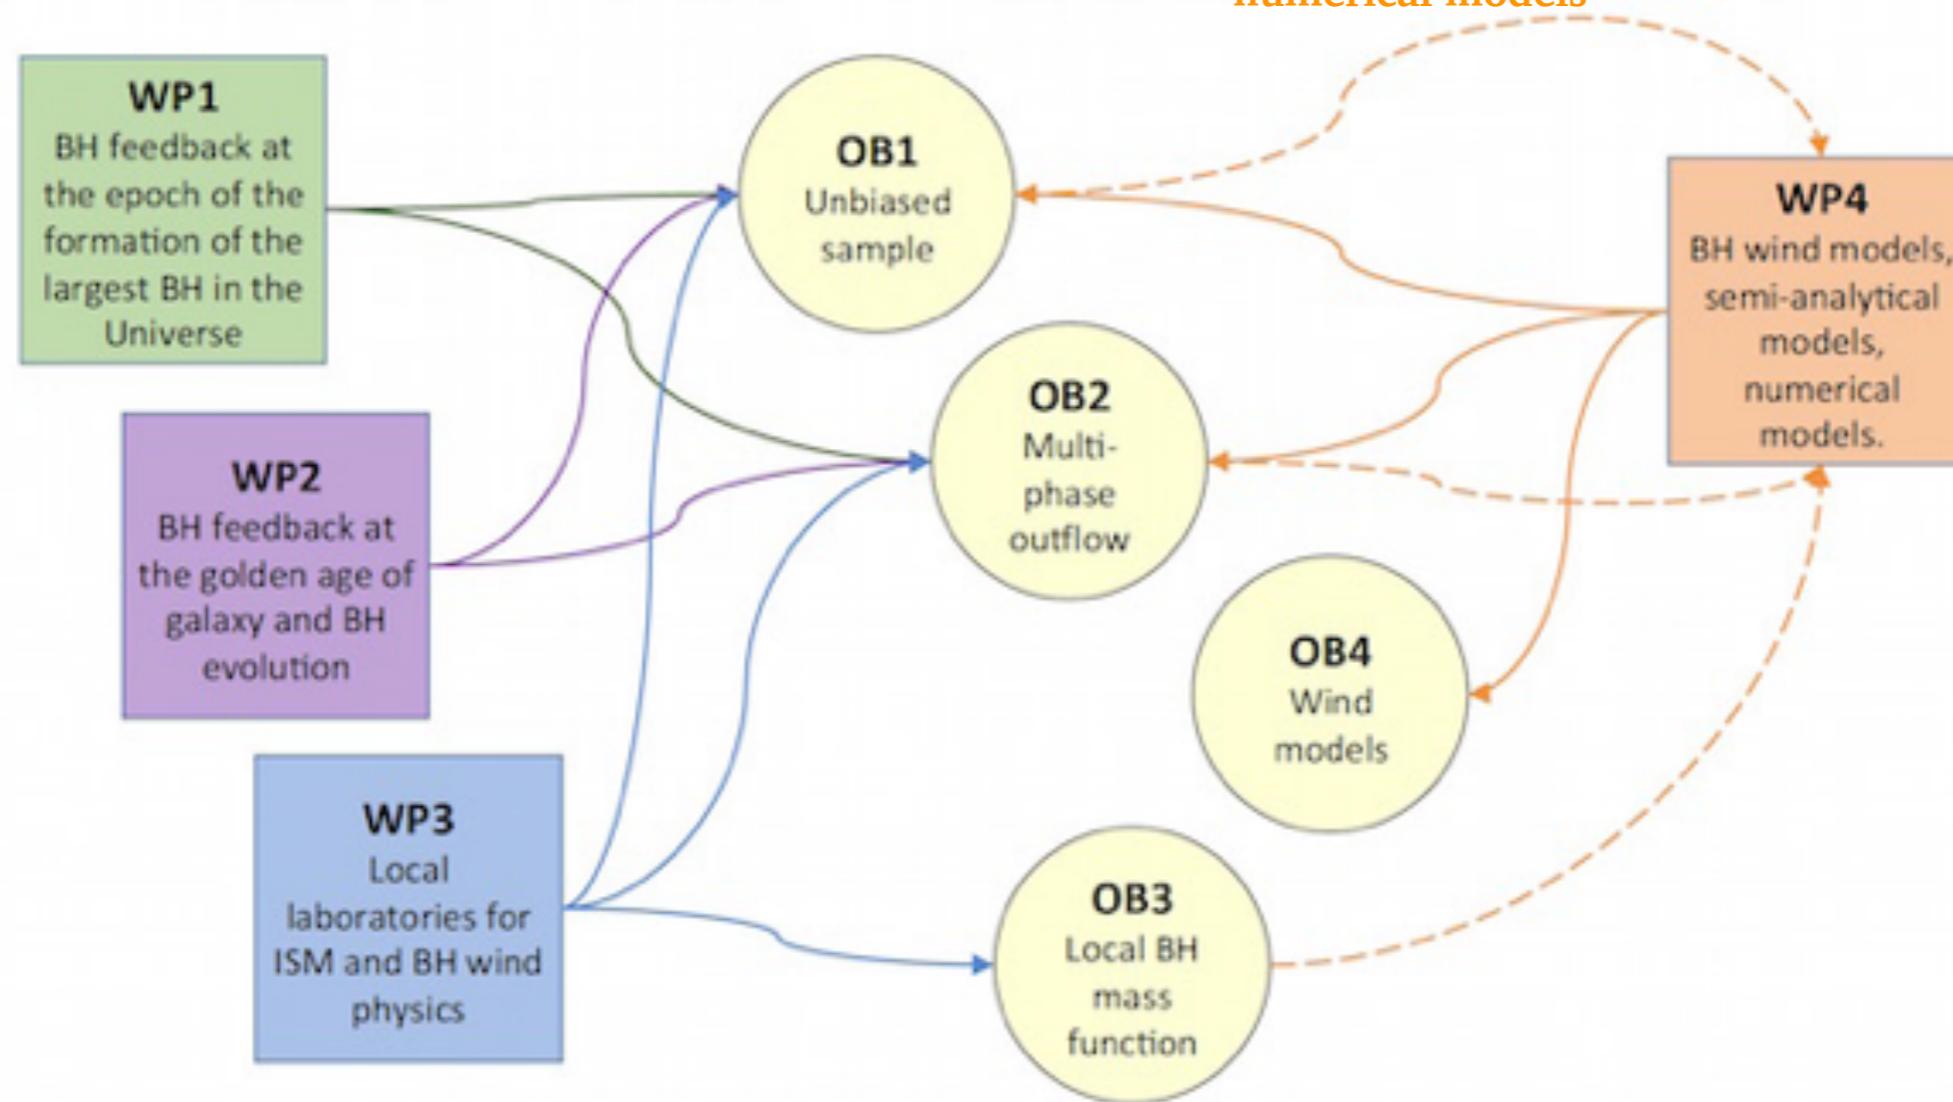

WP1: BH feedback at the epoch of the formation of the largest BH in the Universe

WP2: BH feedback at the golden age of galaxy and BH evolution

WP3: local laboratories for ISM and BH wind physics

WP4: BH wind models, semi-analytical models, numerical models

THE PROJECT: TEAM INVOLVEMENT OAS-UNIBO

	Staff involved
WP1 <i>BH feedback at the golden age</i>	Task 1.1 Leader: Piconcelli, Participants: RTD1 (analysis MUSE and ALMA data) , Fiore, Grazian, Marconi, Venturi, Brusa, Vignali, La Franca, Duras
	Task 1.2 Leader: Fiore, Participants: RTD1 (analysis ALMA data) , PostDoc2 (analysis ALMA data) , Marconi, Piconcelli, Grazian, Gallerani
WP2 <i>local laboratories for BH physics and winds</i>	Task 2.1 Leader: Marconi, Participants: PostDoc2 (analysis SINFONI data) , Venturi, Fiore, Piconcelli, Mannucci, Cresci, Brusa, Vignali, Lanzuisi
	Task 2.2 Leader: Brusa, Participants: RTD3 (analysis ALMA and mw data) , Vignali, Mingozzi, Lanzuisi, Fiore, Piconcelli, Marconi, Cresci, Mannucci
WP3	Task 3.1 Leader: Cresci, Participants: PostDoc1 (analysis ALMA and MUSE data) , Marconi, Mannucci, Fiore, Piconcelli
	Task 3.2 Leader: Fiore, Participants: RTD2 (analysis ALMA and MUSE data) , Malizia, Piconcelli, Cresci, Marconi, Prandoni
	Task 3.3 Leader: Prandoni, Participants: Ruffa, Brusa, Lanzuisi, Fiore, Cresci, Marconi
	Task 3.4 Leader: La Franca, Participants: RTD4 (BH mass functions) , Marinucci, Bianchi, Matt, De Rosa, Cappi, Dadina, Malizia, Fiore, Brusa, Lanzuisi, Marconi, Zaino, Middei, Duras
WP4	Task 4.1 Leader: Marinucci, Participants: RTD4 (BH nuclear wind models, development & comparison with observations) , Bianchi, Matt, De Rosa, Cappi, Dadina, Zaino, Middei
	Task 4.2 Leader: Menci, Participants: Fiore, Piconcelli, Grazian, Gallerani, Marconi, Brusa, Marinucci.
	Task 4.3 Leader: Gallerani, Participants: PostDoc3 (High-resolution, RT simulations with BH feedback) , Orofino, Decataldo, Fiore, Marconi, Brusa, Allevato

Ionised gas, SINFONI/SUPER et al.

molecular gas, ALMA/SUPER et al.

ARCETRI MEETING / first PART: OBJECTIVES

- 1) Unbiased census of BH winds
- 2) Physics of multiphase gas
- 3) Local BH mass functions
- 4) BH wind models

OBJECTIVES

Domanda 1:
Ci sono stati progressi in questi due anni?
qualcuno di questi obiettivi e' stato raggiunto,
o comunque c'e' stato lavoro per raggiungerlo?

ARCETRI MEETING / first PART: OBJECTIVES

1) Unbiased census of BH winds

2) Physics of multiphase gas

3) Local BH mass functions

4) BH wind models

progresses (Bologna-led, incomplete list):

- investigation of multi-phase outflows in single sources:

XID2028 (Brusa+2018, A&A)

Mrk848 (Perna+2019, A&A)

HS0810 (Chartas+2020, MNRAS)

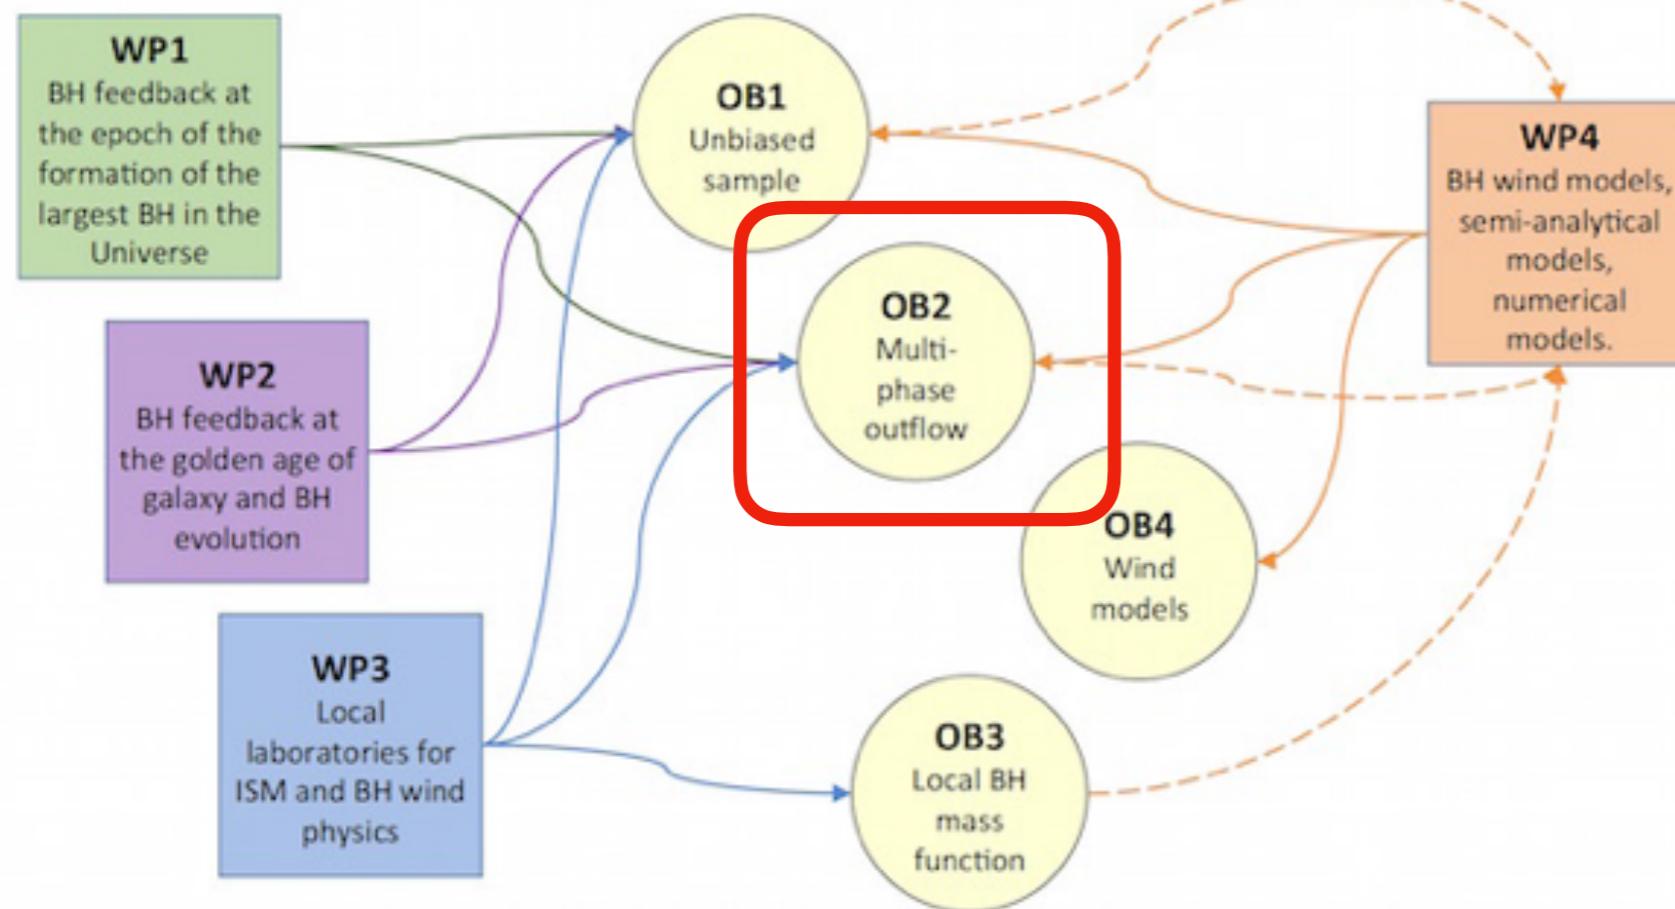

see also PDS456 (Bischetti+2019, A&A)

- investigation of multi-phase outflows in samples:

SUBWAYS program (XMM and mw data coming;

Brusa+, Bianchi +, Feruglio+, Panessa+, Kriss+)

- investigation of indirect evidence of AGN feedback/outflows:
gas content of obscured AGN at $z>1$
(Brusa+2018, Perna+2018, Circosta+2020, Bischetti+2020)
positive feedback from a radio galaxy at $z\sim 1.7$ (Gilli+2019)

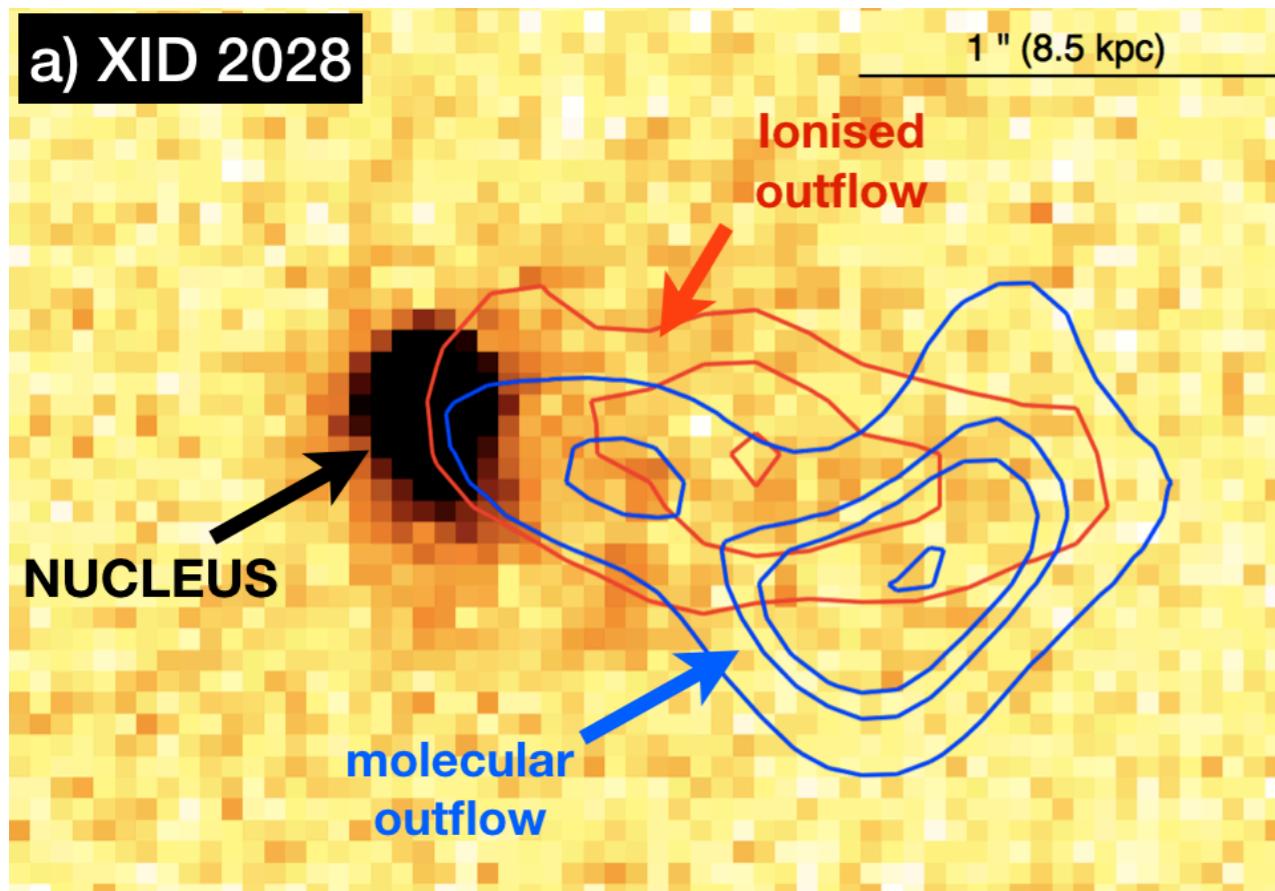

MULTIPHASE OUTFLOWS IN SINGLE SOURCES

XID2028 from XMM-COSMOS (*Brusa+2010, Brusa+2015*)

Brusa+2018

The molecular outflow is **co-spatial** with the ionized outflow

Total mass outflow rate: ~500-800 Msun/yr

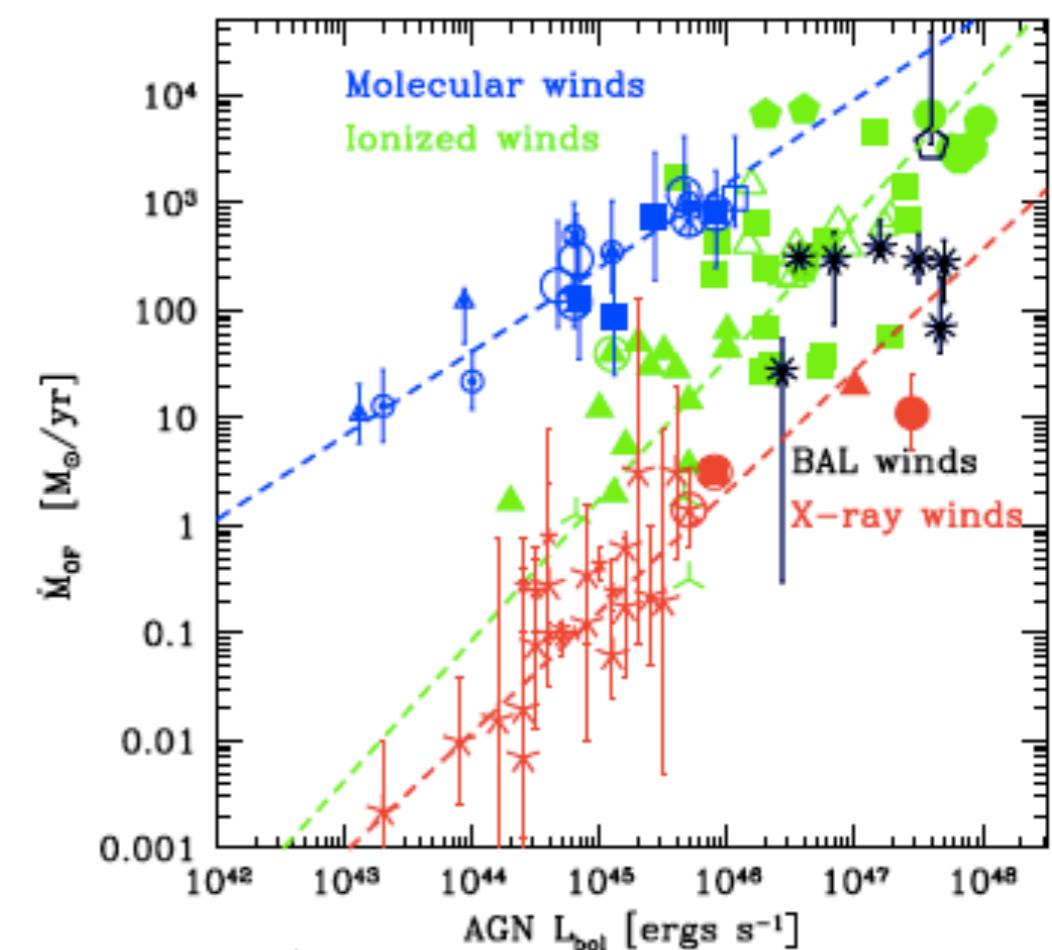

$\dot{M}_{\text{ion}} \sim 300 \text{ Msun/yr}$

$\dot{M}_{\text{neu}} \sim 80 \text{ Msun/yr}$

$\dot{M}_{\text{mol}} \sim 50-350 \text{ Msun/yr}$

(Largest uncertainty: α_{co} (0.13-0.8); see Richings&F-G18)

Fiore+2017

example of a system where molecular and ionised outflow components may be comparable

Is this the rule for all the luminous obscured systems?

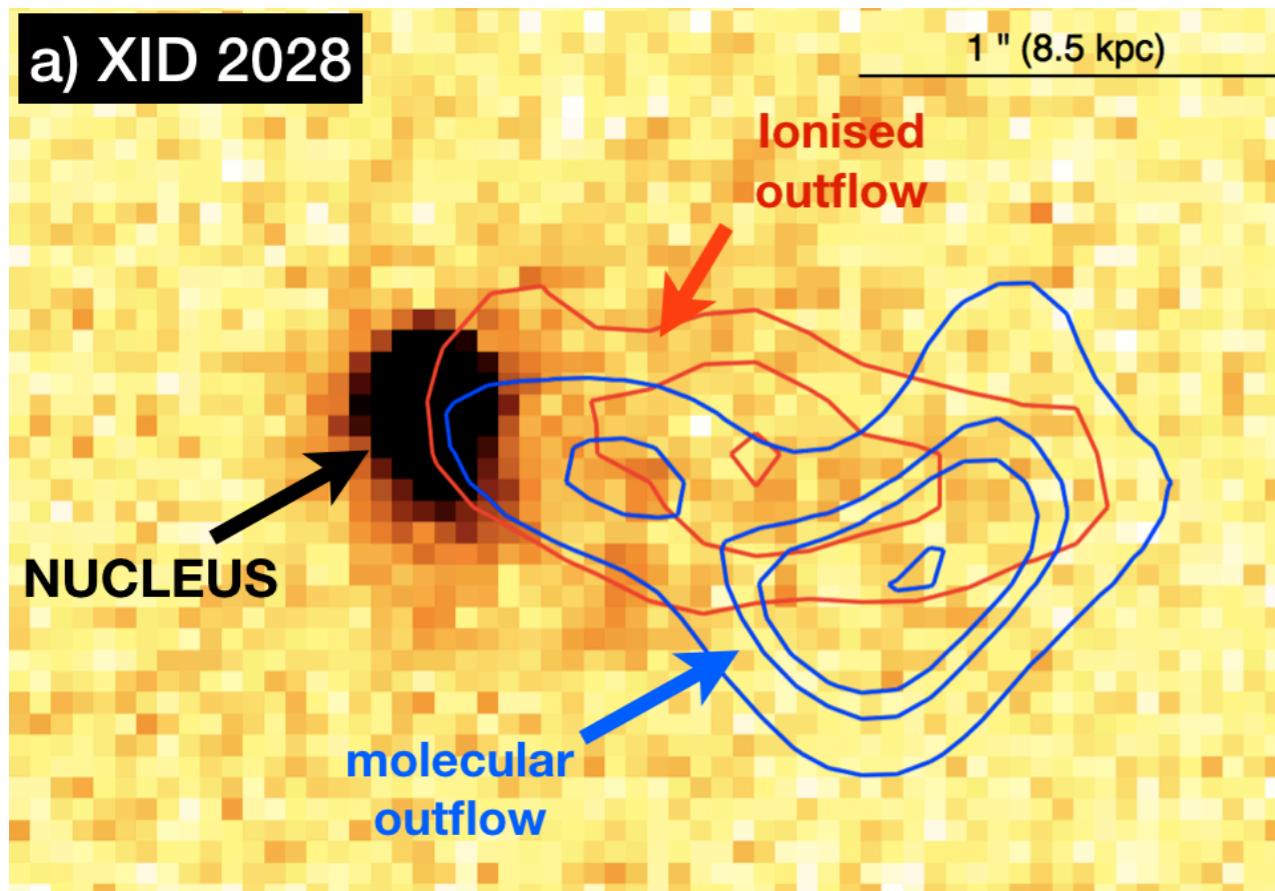

ALMA Cycle 6 data of other 2 targets with powerful ionised outflows (XID5321, XID5395)

MULTIPHASE OUTFLOWS IN SINGLE SOURCES

XID2028 from XMM-COSMOS (*Brusa+2010, Brusa+2015*)

Brusa+2018

The molecular outflow is **co-spatial** with the ionized outflow

Total mass outflow rate: ~500-800 Msun/yr

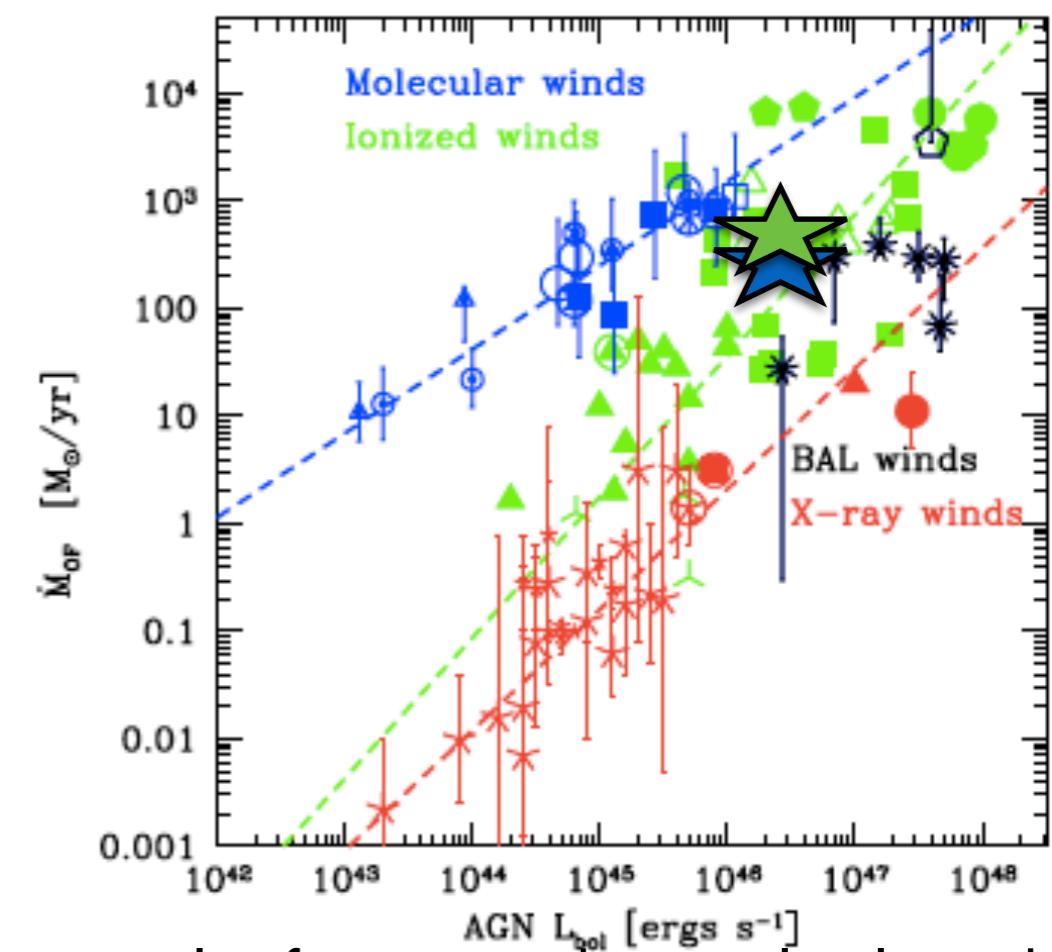

$\dot{M}_{\text{ion}} \sim 300 \text{ Msun/yr}$

$\dot{M}_{\text{neu}} \sim 80 \text{ Msun/yr}$

$\dot{M}_{\text{mol}} \sim 50-350 \text{ Msun/yr}$

INDIRECT EVIDENCE OF AGN FEEDBACK/OUTFLOWS: GAS FRACTION

XID2028

Brusa et al. 2018 (see Brusa+2015 PdBI)

**Depletion time scale 10x below that of
inactive galaxies of similar SFR/M***

literature scaling relations

($z=1.6$ & $10.7 < \log(M_*/M_\odot) < 11.6$):

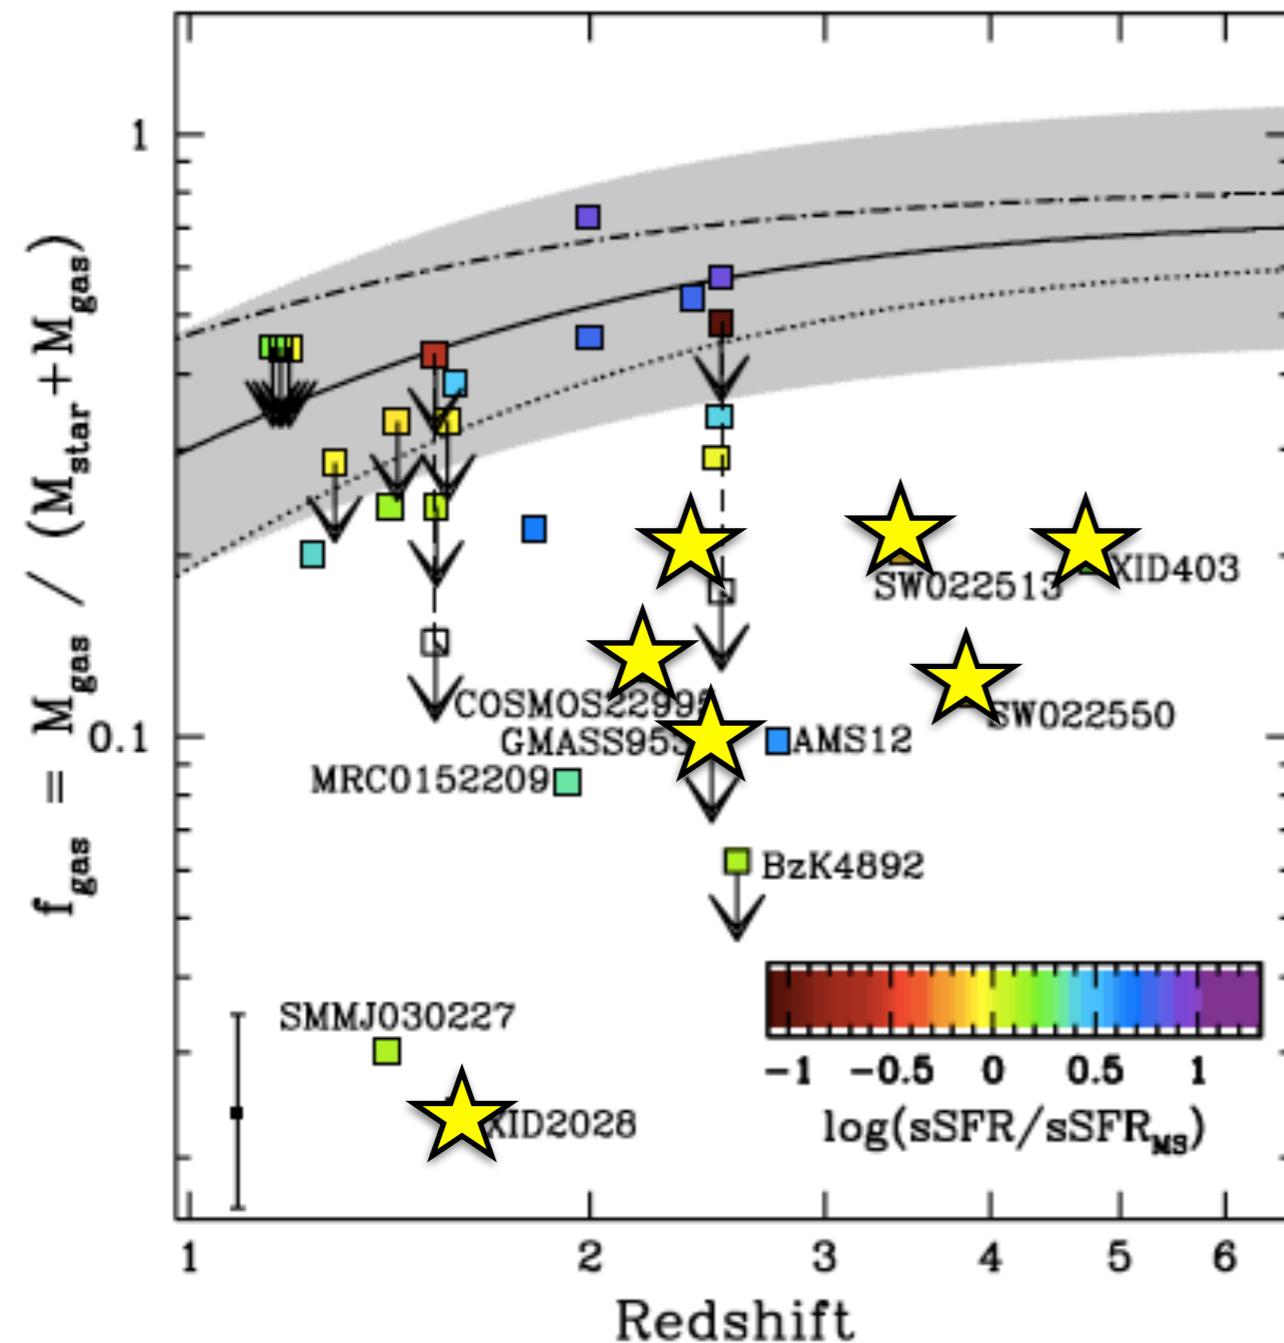

- Tacconi et al. (2017)
- ... Scoville et al. (2017)
- Sargent et al. (2014)

**Evidence for higher SFE in converting
into stars the residual gas ?**

**removal of molecular gas and/or change
into ionised phase?**

INDIRECT EVIDENCE OF AGN FEEDBACK/OUTFLOWS: GAS FRACTION

Perna+2018, A&A

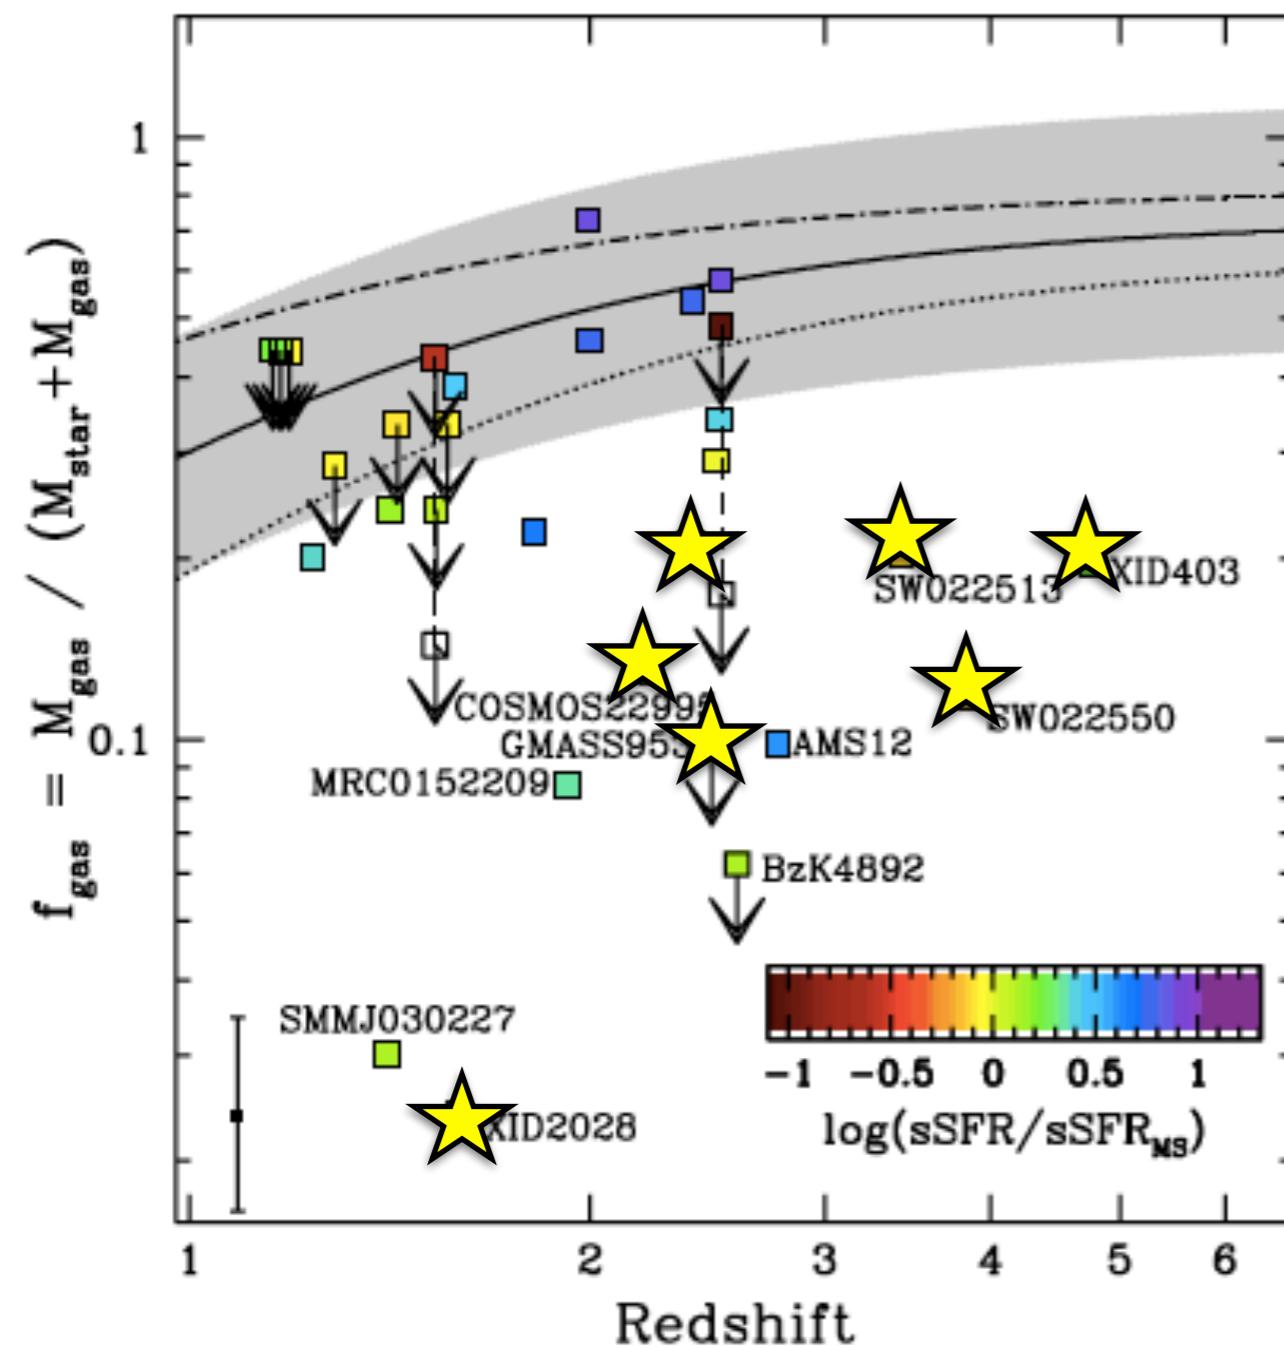

Gas fractions for **obscured quasars at $z=1-6$
lower than mass matched inactive samples**

A factor **2-10 difference in gas fraction in
AGN vs. non-AGN host**

difference still present if $\alpha_{\text{CO}}=4$

INDIRECT EVIDENCE OF AGN FEEDBACK/OUTFLOWS: GAS FRACTION

Perna+2018, A&A

Gas fractions for **obscured quasars at $z=1-6$
lower than mass matched inactive samples**

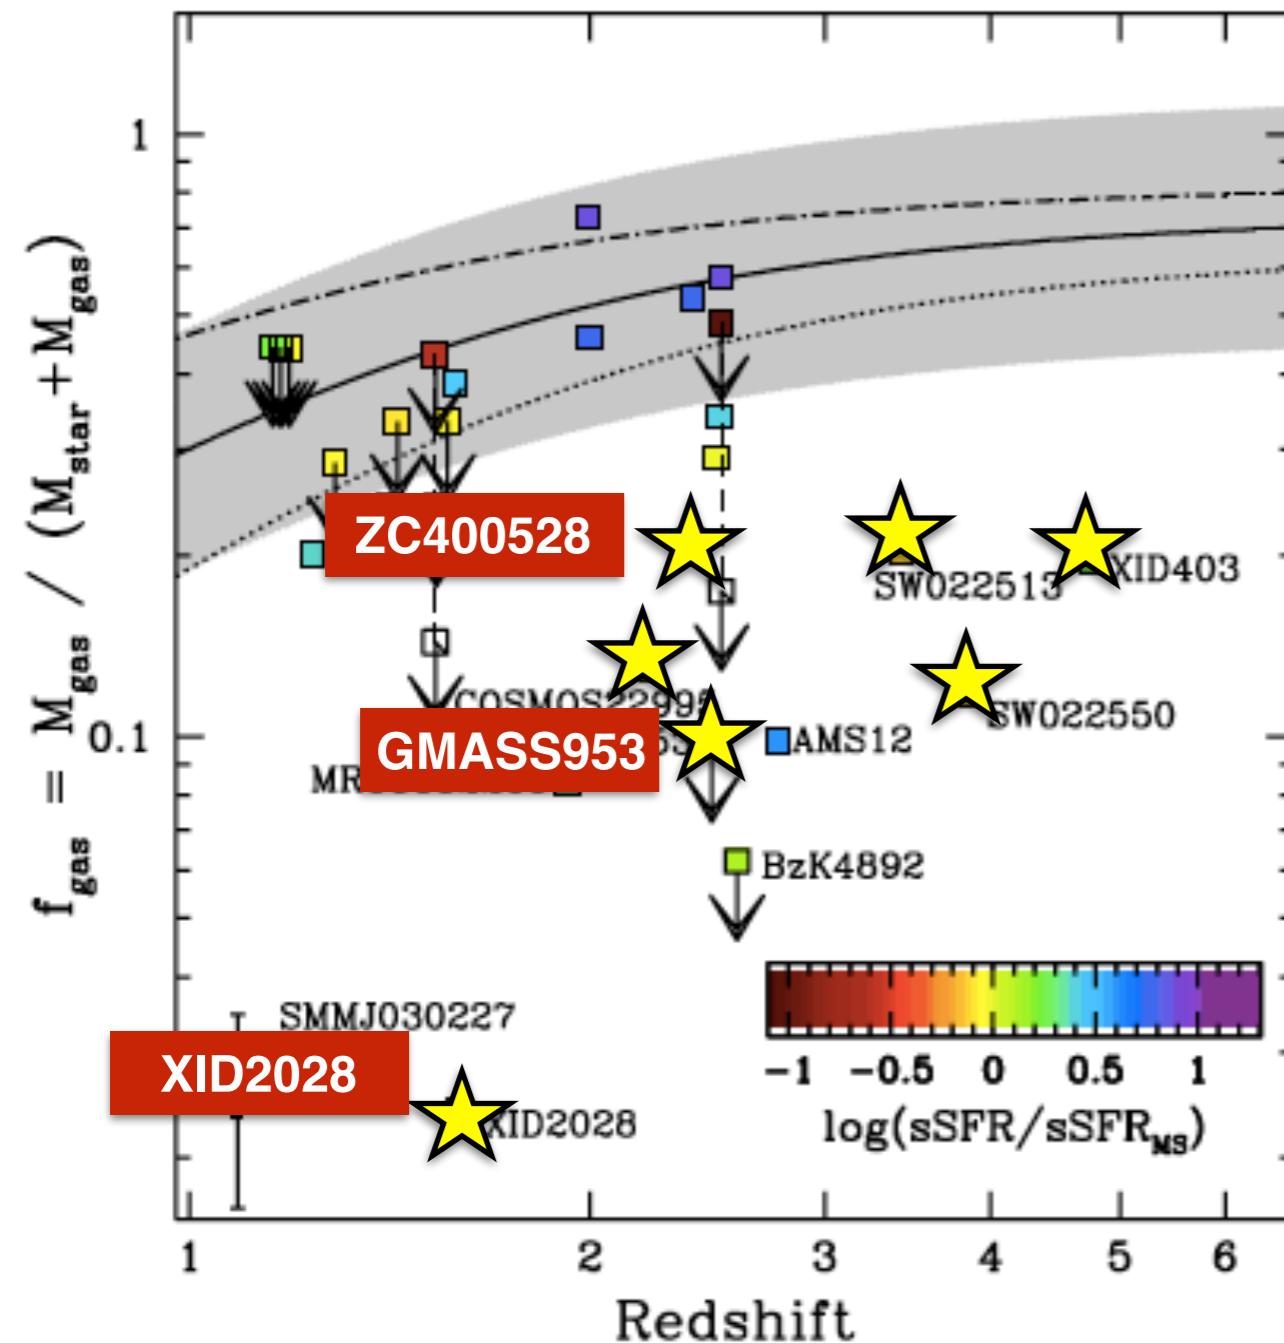

A factor **2-10 difference in gas fraction in
AGN vs. non-AGN host**

difference still present if $\alpha_{\text{CO}}=4$

**AGN with outflows in at least one
phase (large stars) displaying
among the strongest deficits !**

INDIRECT EVIDENCE OF AGN FEEDBACK/OUTFLOWS: GAS FRACTION

Perna+2018, A&A

Gas fractions for **obscured quasars at z=1-6
lower than mass matched inactive samples**

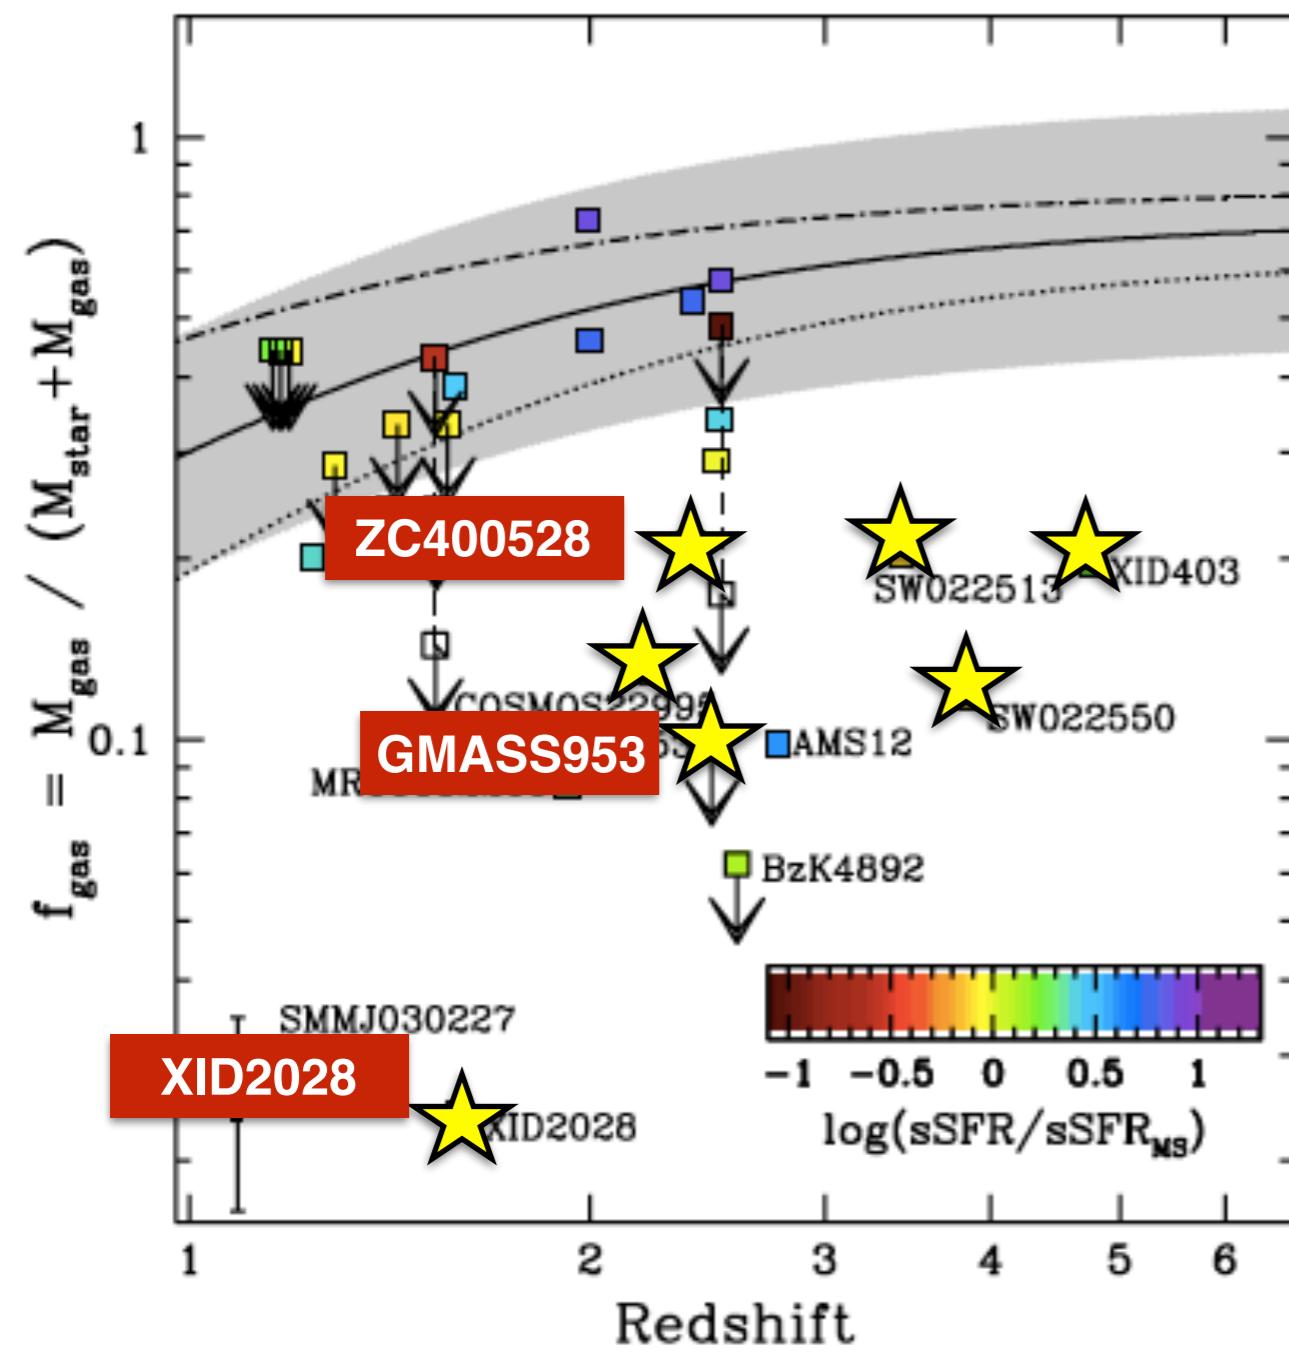

A factor **2-10 difference in gas fraction in
AGN vs. **non-AGN** host**

difference still present if $\alpha_{\text{CO}}=4$

**AGN with outflows in at least one
phase (large stars) displaying
among the strongest deficits !**

among the strongest deficits !**

*lower molecular gas
fraction confirmed
also in SUPER AGN
(Circosta+, submitted)*

“tension” with local works (no difference): Rosario+2017, Husemann+2018, but see IBISCO

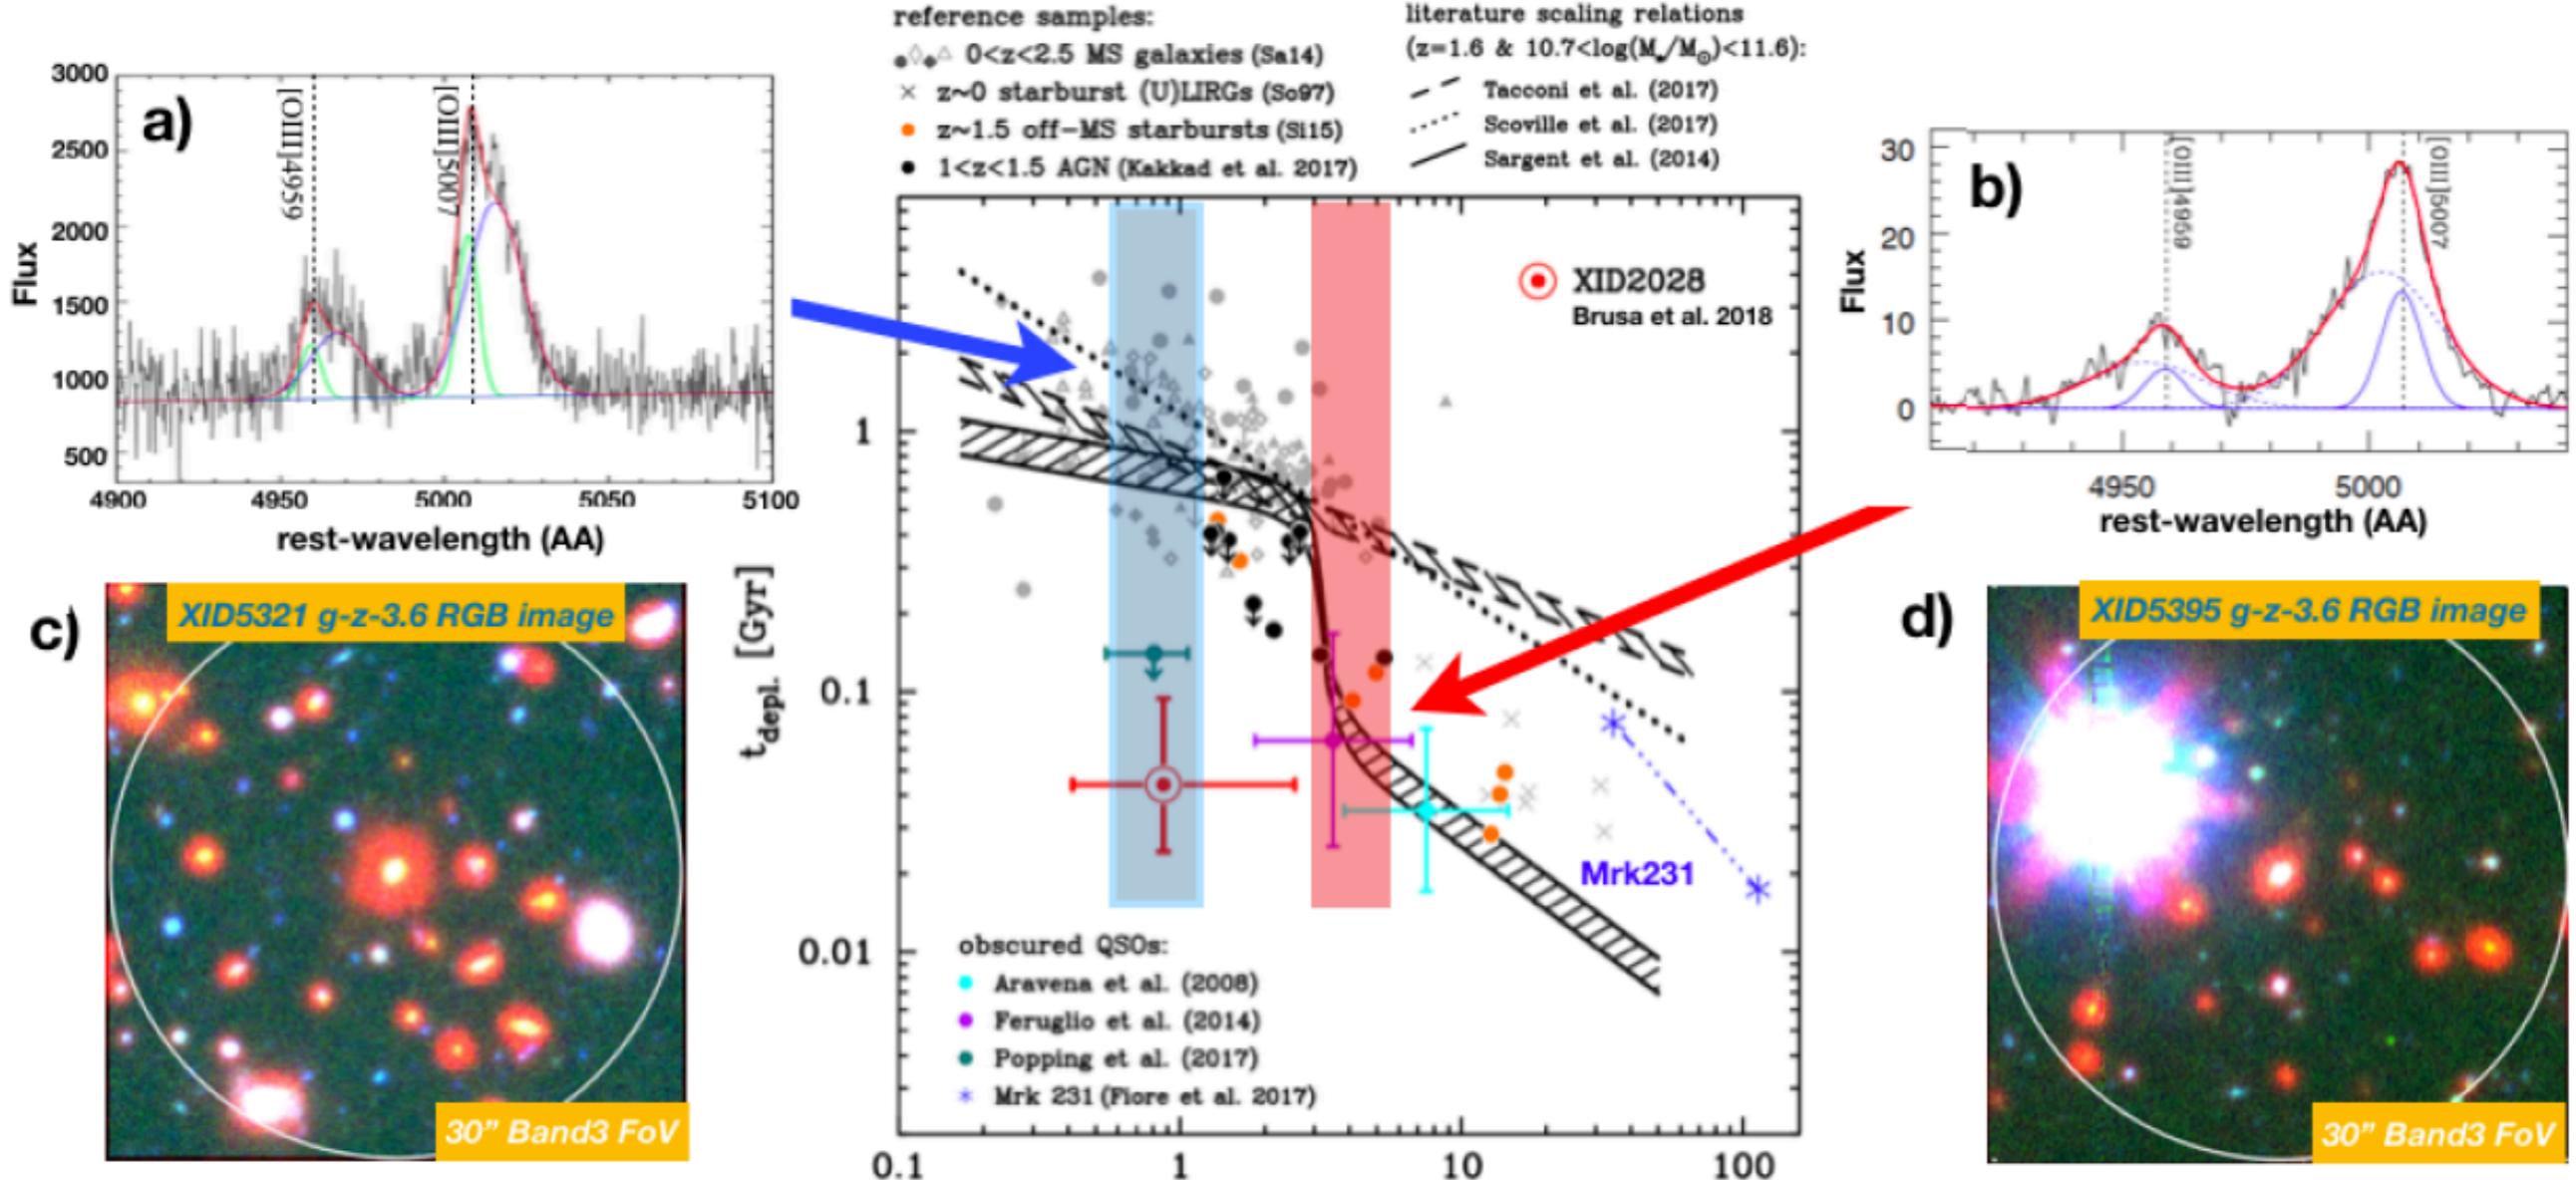

WORK IN PROGRESS: XID5321, XID5395

**2 luminous obscured Quasars from XMM-COSMOS
observed in CO(2-1) and CO(5-4) with ALMA at intermediate resolution (0.4"-1")**

WORK IN PROGRESS: XID5321, XID5395

**2 luminous obscured Quasars from XMM-COSMOS
observed in CO(2-1) and CO(5-4) with ALMA at intermediate resolution (0.4''-1'')**

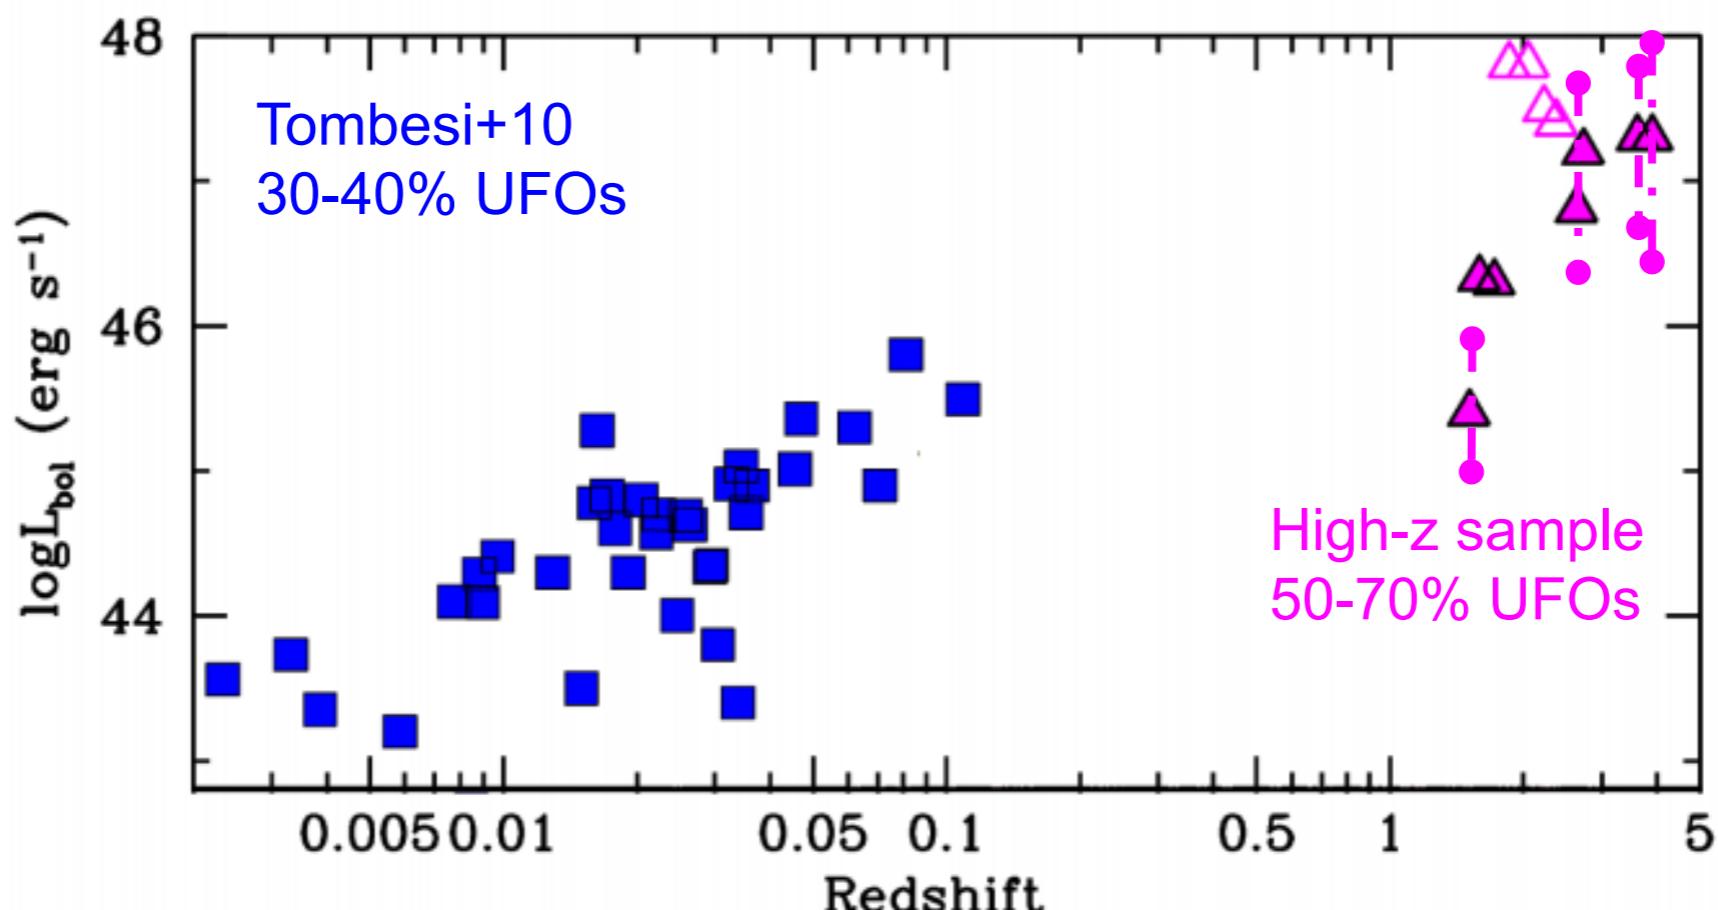

—> **FEDERICA RICCI will take the lead of the project**

SUBWAYS: SUPERMASSIVE BLACK HOLE WINDS IN X-RAYS

AGN disk wind studies limited to

- 1) $z < 0.1$ on a large sample (>50 objects) at Seyferts luminosities, $L_{\text{bol}} < 10^{45}$ erg/s (Tombesi+10, Gofford+13)
- 2) $z > 1.5$ on small and sparse samples (<10 objects) at $L_{\text{bol}} > 10^{46}$ erg/s (Chartas+09,16, Lanzuisi+12, Vignali+15, Dadina+18)

SUBWAYS: SUPERMASSIVE BLACK HOLE WINDS IN X-RAYS

1.6Ms XMM-Newton LP accepted in AO18

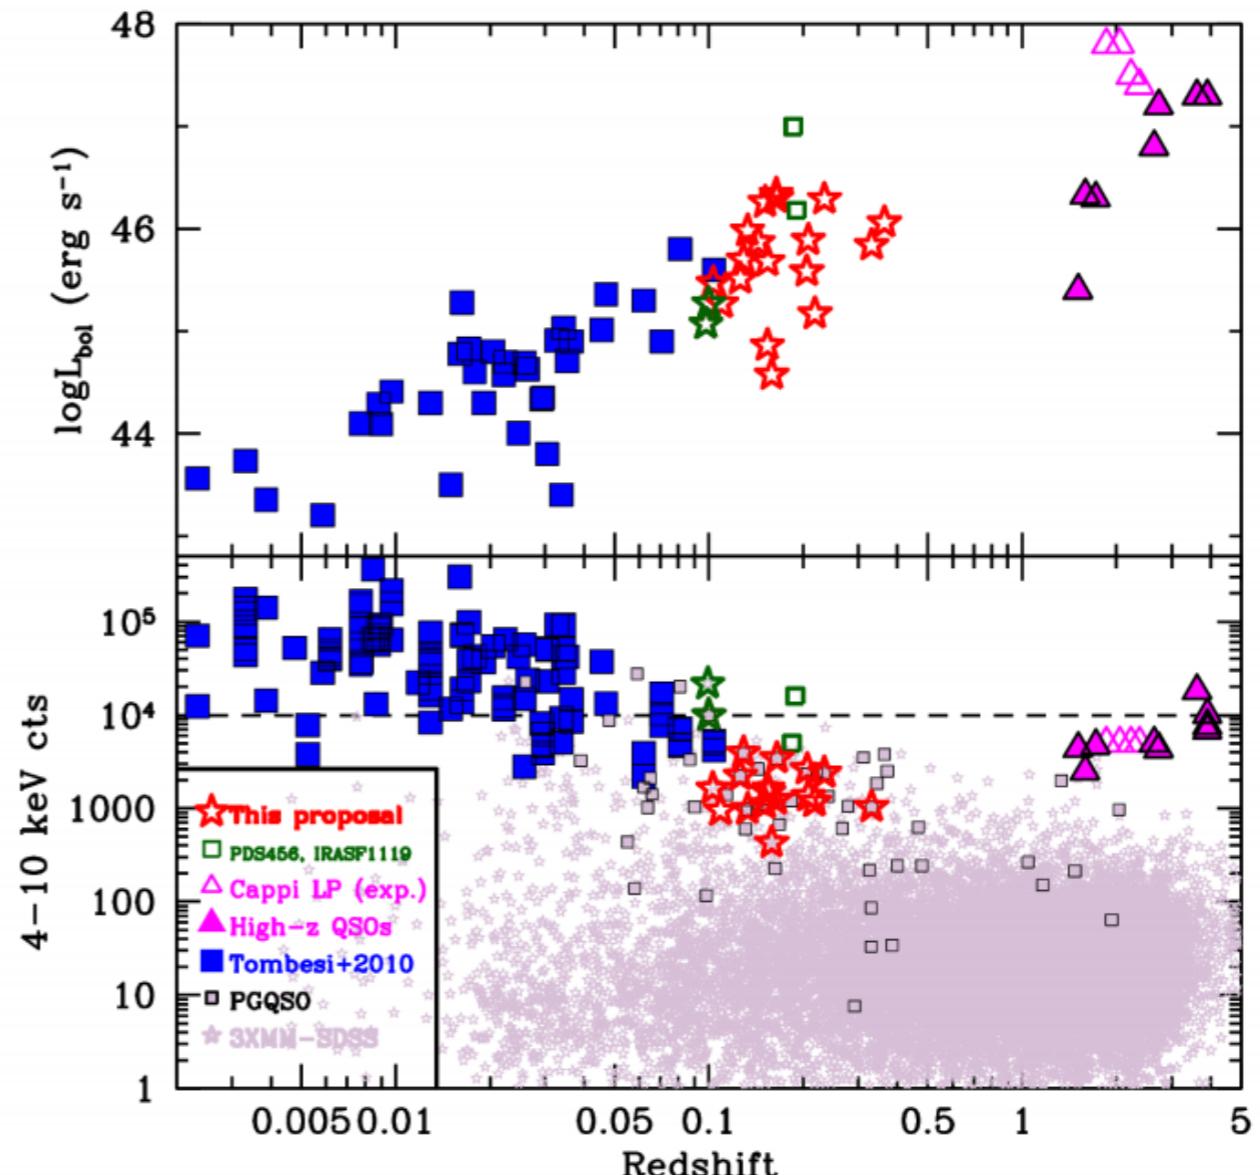

Selection criteria:

(1) presence in the **3XMM-DR7+SDSS-DR14** catalogs (or to the **PG QSO catalog** – crucial to tune the requested observing time

(2) redshift in the range **$z=0.1-0.5$** (both WAs and UFOs can be studied)

(3) count rate larger than ~ 0.12 cts/s, to ensure ~ 10000 counts **4-10keV** obtainable within a single XMM orbit

(4) BH Mass & Eddington ratio available

SUBWAYS: SUPERMASSIVE BLACK HOLE WINDS IN X-RAYS

Goals:

(1) UFO detection fraction and duty cycle

expected 5-13 UFOs detections —> OBJ 1 (unbiased census of BH winds)

(2) UFO energetics

\dot{M}_{out} and E_k derived assuming biconical wind geometry (plus new models, e.g. Luminari+18)

(3) Combined low and high-z/Lum sample

to study winds presence over 3-4 dex of L_{bol} , λ_{Edd} , M_{BH}

(4) Relation of UFO with large scale outflows

- 60% of the sample have indication of kpc-scale outflows in OIII (Perna+17)

- primary targets for MUSE, ALMA and NOEMA proposals

UFO detection rate 23-30%?
(35-45% with archival sample...)
N.B: situation at ~May2020

Overall spectral complexity
(soft excess, WA, complex lines etc.)

SUBWAYS: FOLLOW-UP PROPOSALS

- HST COS (PI Kriss)
- FUV Spectroscopy of **16 QSOs** of the LP sample (no obscured sources). **27 Orbits** requested, almost all data taken (2 missing).
- Will cover all important UV spectral features: OVI+Ly β , Ly α , NV, SiIV, and CIV for ~simultaneous observations
- NOEMA (PI Feruglio) CO lines, gas mass measurement
- **9 PG QSOs** at north, accepted in **B category**,
- some data already taken
- VLA (PI Panessa) 1.4,6GHz, radio core/continuum
- **almost full sample**, including some of the archival data, **C priority**
- NuSTAR (PI Bianchi) Continuum, Ecut, **full sample**
- MUSE (PI Cresci) [OIII] extend emission, **subsample visible from ESO – NOT accepted** → to be resubmitted in P107 → suspended
- ALMA (PI Brusa): CO lines+continuum, gas mass+ outflow
subsample visible from ALMA, **NOT accepted** → to be resubmitted in Cycle 8 → moved to April 2021
- **JWST?**

BLACKOUT KICK-OFF MEETING
